WebDemo Project

It is a Java Web Project created to test the security vulnerabilities supported by the plug-in.

When the developer marks a project to be monitored by the plug-in, all the "*.java" files will be scanned when the plug-in detects that they have being saved. This project contains almost 200 known security vulnerabilities. To avoid all these vulnerabilities at once on the security view. We renamed the files to "*.java2".

If you want to test one specific file just rename it back to "*.java" and save it. If you want to test all the files, repeat this process on all the files.
